                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New bradykinin analogues are disclosed which include intramolecular cyclisation via side chains to provide a rigid structure having enhanced affinity for the bradykinin receptors. Specifically, amino acid substitutions are made at positions 2 and 5 or 6 to facilitate cyclisation of the peptide through covalent bonding. Examples of suitable substitutions are Cys for disulphide bonding and Lys with cluor app for amide bond formation. An additional residue is added the contraction of the peptide through covalent bonding and Lys with cluor app for amide bond formation. An additional residue is added the contraction of the contraction of the peptide through covalent bonding and Lys with cluor app for amide bond formation. An additional residue is added the contraction of the contraction of the contraction of the contraction of the peptide through covalent bonding and Lys with cluor app for amide bond formation. An additional residue is added the contraction of the covalent bonding and covalent bonding and Lys with cluor applications of the covalent bonding and Lys with contraction of the peptide through covalent bonding and Lys with contraction of the peptide through covalent bonding and Lys with contraction of the peptide through covalent bonding and Lys with contraction of the peptide through covalent bonding and Lys with covalent bonding and Lys with contraction of the covalent bonding and Lys with contraction of the covalent bonding and Lys with covalen

The antibodies bind to BLys and so may be used to detect and quantitate the presence of BLys in associated with aberrant expression of BLys. They may also be administered to treat diseases associated with aberrant ELYS expression and activity such as cancer, immune, and autoimmune disorders and immunodeficiency (e.g. common variable immunodeficiency (c.g. common variable immunodeficie

BLyS is a member of the tumour necrosis factor (TNF) super family and induces B cell proliferation and differentiation. The antibodies of the invention have
                                                                                                                                                           Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to Bordetella bronchiseptica pertactin (outer membrane protein) or their fragments. Pertactin (PRN) is used as vaccine. Pertactin antibody is useful for treating Bordetella infections and used to detect Bordetella antigens in biological preparations or in purifying corresponding proteins, glycoproteins or their mixtures when used in affinity chromatographic columns. Pertactin is useful as antigens to identify antibodies to Bordetella in materials such as human or other animal cells, as well as biological fluids, such as human or other animal body fluids, including human sera, and to determine the concentration of Ab in those materials. Thus the

                                                                                                                                                           dermal papilla, human keratinocytes and neonatal foreskin fibroblasts, and mouse embryonic skin, keratinocyte stem cells and transit amplifying cells. Polypeptides of the invention may be used to treat inflammation, cancer and neurological diseases. The proteins may be used to stimulate the growth and motility of keratinocytes, to inhibit the growth of cancer cells, to modulate angiogenesis and tumour vascularisation, to modulate skin inflammation, to modulate epithelial cell growth and to inhibit binding of HIV-1 to leukocytes. The invention may also be used to treat growth and developmental defects, skin vounds and hair follicle disorders. Sequences ANY75942-Y76121 represent polypeptides encoded by cDNA sequences ANY75947-Y7547, ANY76020-Y76021, ANY76094-Y76104 and hair cell types. Sequences ANY75947-Y7547, ANY76020-Y76021, ANY76094-Y76104 and hair cell types.
                                                                          AAY76119 are proteins with an N-terminal signal sequence, indicating that they are secreted. Sequences AAY75986-Y75989, AAY76061-Y76071, AAY76106-Y76109 and AAY76111-Y76122 are proteins with one or more

The present sequence is a polypeptide which is expressed in mammalian skin cells. The polypeptide is useful for stimulating keratinocyte growth and motility, inhibiting the growth of cancer cells, modulating angiogenesis, inhibiting angiogenesis and vascularisation of tumours, modulating skin inflammation, stimulating the growth of epithelial cells, inhibiting the binding of human immunodeficiency virus (HIV)-1 to leukocytes, and treating inflammatory disease, cancer and neurological diseases. The polynucleotide can be used as a marker, in the identification of genetic disorders, and for the design of oligonucleotides for examining expression patterns.
                                                                                                                                                                                                                                                                                                          Claim 4;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                nouse; skin cell; cytostatic; antiinflammatory; anti-HIV; nootropic; neuroprotective; vulnerary; immunomodulatory; vaccine; keratinocyte growth stimulation; cancer; angiogenesis inhibition; inflammation; neurological disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cancer and neurological diseases. The proteins may be used to stimulate the growth and motility of keratinocytes, to inhibit the growth of cancer cells, to modulate angiogenesis and tumour vascularisation, to modulate skin inflammation, to modulate epithelial cell growth and to inhibit binding of HIV-1 to leukocytes. The invention may also be used to treat growth and developmental defects, skin wounds and hair follicle disorders. Sequences AAY75942-Y76123 represent polypeptides encoded by cDNA sequences derived from several mouse, rat or human skin cell types. Sequences AAY75942-Y75947, AAY76021, AAY76094-Y76104 and AAY76119 are proteins with an N-terminal signal sequence, indicating that they are secreted. Sequences AAY75986-Y75989, AAY76061-Y76071, AAY76106-Y76109 and AAY76121-Y76122 are proteins with one or more putative transmembrane domains
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      N-PSDB; AAC99600
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        15-MAY-2000; 2000WO-NZ00075

                                                               The present sequence is a polypeptide which is expressed in mammalian skin cells. The polypeptide is useful for stimulating keratinocyte growth and motility, inhibiting the growth of cancer cells, modulating anglogenesis, inhibiting anglogenesis and vascularisation of tumours, modulating skin inflammation, stimulating the growth of epithelial cells, inhibiting the binding of human immunodeficiency virus (HIV)-1 to leukocytes, and treating inflammatory disease, cancer and neurological diseases. The polynucleotide can be used as a marker, in the identification of genetic disorders, and for the design of oligonucleotides for examining expression patterns.
                                             Sequence
                                                                                                                                                                                                                                     Claim 4;
                                                                                                                                                                                                                                                         New isolated polynucleotide used in the identification of genetic disorders and encoding polypeptides used for treating inflammatory disease, cancer and neurological diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                            14-MAY-1999;

                                                                                                                                                                                                                                                                                                                                   The present invention provides the protein and coding sequences of cDNAs isolated from human, murine and rat skin cell libraries. The sequences can be used in the development of therapeutic agents useful in the treatment of skin diseases, including skin wounds, cancer, growth defects, developmental defects and inflammatory diseases. The proteins have important roles in the induction of hair growth, cell proliferation and cell-cell interaction, in maintaining tissue integrity, in wound healing and in modulating immune responses. The present sequence is a polypeptide of the invention.

The present invention provides the protein and coding sequences of cDNAs isolated from human, murine and rat skin cell libraries. The sequences can be used in the development of therapeutic agents useful in the treatment of skin diseases, including skin wounds, cancer, growth defects, developmental defects and inflammatory diseases. The proteins have important roles in the induction of hair growth, cell proliferation and cell-cell interaction, in maintaining tissue integrity, in wound healing and in modulating immune responses. The present sequence is a polypeptide of the invention.
                                                                                                                                                                                                                 New polynucleotides and polypeptides encoded by the polynucleotides isolated from skin cells, useful for treating skin wounds, cancers, growth and developmental defects, inflammatory diseases, or for modulating immune responses -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             δÃ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to the isolation of genes AAC93310-C93354 encoding C the human secreted proteins AAB51380-B51423. The genes and proteins are useful for preventing, ameliorating or treating medical conditions, e.g. C by protein or gene therapy. The genes are isolated from a range of human CC tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and CC prevention of: (a) cancer, e.g. breast and ovarian cancer, and other CC cancers of the adrenal gland, bone, bone marrow, breast, and other CC gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders CC e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, CC autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple CC cardiovascular disorders such as myocardial ischaemias; (d) wound CC healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and containt of the containt of th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches

The genes and proteins are useful for preventing, ameliorating or treating medical conditions, e.g. by protein or gene therapy. The genes are isolated from a range of human antibodies and (ant)agonists are useful in the diagnosis, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer, and other cancers of the adrenal gland, bone, bone, bone, breast, former additional cancer and other cancer and the cancer and cancer and

 The invention relates to the isolation of genes AAC93310-C93354 encoding the human secreted proteins AAB51380-B51423. This sequence represents a fragment of the protein encoded by the gene isolated in the present invention. The sequence is used as a query sequence for doing BLASTX
                                                                                                                    New nucleic acid molecules encoding 45 human secreted proteins for diagnosing, preventing, treating or ameliorating medical conditions used as food additives or preservatives -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (ant)agonists are useful in the diagnosis, treatment and prevention of:
(a) cancer, e.g. breast and ovarian cancer, and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, Theumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases eguital habeterial functions and (f) infectious diseases such

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   searches to determine homologous sequence to the protein. The genes and proteins are useful for preventing, ameliorating or treating medical conditions, e.g. by protein or gene therapy. The genes are isolated for may a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and covarian cancer, and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune theoroiditis, diabetes mellitus (c) cancers of the darenal gland, bone to the amenity tic anaemia, autoimmune thyroiditis, diabetes mellitus and concersive colitis; (c) cardiovascular disorders such as myocardial conversative colitis; (c) cardiovascular disorders such as myocardial conversative colitis; (c) cardiovascular disorders such as myocardial conversative colitis; (d) cond healing; (e) neurological diseases e.g. cerebral conversation and epilepsy; and (f) infectious diseases such as viral, or bacterial, fungal and parasitic infectious.

```
ABN90538 to ABN93374 represent Staphylococcus epidermidis open reading frame (ORF) nucleic acid sequences which encode the amino acid sequences given in ABP35124 to ABP37960. The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to screen for compounds able to interfere with the S. epidermidis life cycle or inhibit S. epidermidis infection.

N.B. The sequence data for this patent did not form part of the printed

CC The sequence comprises the first 95 amino acid residues of the Cl alpha chain of the class II MHC from human DQA1*0101. It contains CC a highly conserved region that is maintained across alleles and CC species (see also AM21827 and AM21828). A novel method of suppressing CC an immune response comprises administering a class II MHC alpha CC chain, or a fragment (see also AM21830-32), that can suppress at CC least one of the following: a mixed lymphocyte reaction or other CC T-cell allorecognition reaction; generation of cytotoxic T-cells CC antigen; and slimulatory cytokine production by lymphocytes. Immune CC responses that can be abated or suppressed include alloimmunity Cc (e.g. in organ transplantation) and autoimmunity (e.g. in multiple CC sclerosis or rheumatoid arthritis). Immune responses can be down-transmer-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    RESULT 15

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
